HI,

I would like to request the following searches: SEQ ID NO:6 and 30 in the protein databases (commercial & interference).

Please provide a hard copy of this search.

Thank you very much,

delia.ramirez@uspto.gov

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Fermentation of E. coli having an altered amino acid sugar metabolic pathway to produce glucosamine, especially using novel recombinant variant glucosamine-6-phosphate synthases.

Claim 28; Page 124-126; 150pp; English.

The present sequence is that of a mutant, denoted GlcN6P-S-54, of the glucosamine-6-phosphate synthase (GlcN6P synthase) of Escherichia coli

ژن 8 Leanna C; Wassink S

```
The present invention relates to a method (M1) for producing glucosamine and N-acetylglucosamine by fermentation. The method comprises (a) culturing in a fermentation medium a microorganism (1) which comprises endogenous glucosamine-6-phosphate acetyltransferase (II) and a genetic modification that increases the activity of (II), glucosamine-6-phosphate synthase (III) or glucosamine-6-phosphate deaminase (IV), or decreases the activity of glucosamine-6-phosphate phosphate N-acetyltransferase (V), and (b) and collecting the product, which is chosen from the group consisting of glucosamine-1 phosphate, N-acetylglucosamine-6-phosphate, N-acetylglucosamine-6-phosphate, N-acetylglucosamine-1-phosphate, N-acetylglucosamine-T-phosphate, N-acetylglucosamine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Producing glucosamine or N-acetylglucosamine by fermentation involves culturing microorganism comprising glucosamine-6-phosphate acetyltransferase, in fermentation medium, and collecting product.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      IGLGMGENFIASDOLALLPVTRRFIFLEEGDIAEITRRSVNIFDKTGAEVKRQDIESNLQ

When compared with the wild-type sequence (see AAV58822), the mutant includes A39T, R250C and G472S amino acid substitutions. These alterations are predicted from the mutated glms gene in plasmid pKLN23-54 (see AAZ58751). The invention provides methods for the overproduction of glucosamine by fermentation using a genetically engineered microorganism, especially E. coli, that includes a modified GlcN6P synthase. Production of the glucosamine by recombinant strain 1213-54 (pKLN23-54) was significantly increased when compared to a strain expressing wild-type GlcN6P synthase owing to reduced product inhibition. Glucosamine concentrations of over 12 g/l have been obtained
                                                                                                                                                                                                                                                                                                                                                    9
                                                                                                                                                                                                                                                                                                                                                                                       9

The specification describes a method for producing chitin or chitosan by a fermentation process. The method involves culturing in a fermentation medium a microorganism which comprises one or more genetic modifications that result in an increase in the activity of glutamine-fructose-6-phosphate amidotransferase (also known as glucosamine synthetase and allocosamine-6-phosphate synthase, and encoded by the GFAH eukaryotic gene and the glmS bacterial gene), glucosamine-6-phosphate acetyltransferase (encoded by GNAI), chitin synthase or chitin deacetylase (encoded by CDAI
                                                                       480

and CDA2), or in decrease in the activity of N-acetylglucosamine-6-phosphate deaminase, chitinase and chitosanase, and collecting the chitin or chitosan. The method is useful for producing chitin or chitosan by utilizing microorganisms such as fungus, yeast (e.g. Saccharomyces or Schizosaccharomyces) and filamentous fungus (e.g. Aspergillus, Absidia or Rhizopus), preferably Scerevisiae, A. nigus or A. nidulans. The method enables high quantities of chitin and chitosan to be produced cost effectively. The present sequence represents a mutant glucosamine-6-phosphate synthase, encoded by glmS*54. This enzyme is resistant to feedback inhibition by glucosamine-6-phosphate. The polymucleotide was used to transform yeast for use in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        240

```
The present sequence is that of a mutant, denoted GlcN6P-S-149, of the glucosamine-6-phosphate synthase (GlcN6F Synthase) of Escherichia coli. When compared with the wild-type sequence (see AAY58822), the mutant includes a Ser for Gly-472 amino acid substitution. This alteration was predicted from the mutaced glms gene in plasmid pXLN23-149 (see AAX5853). The invention provides methods for the overproduction of glucosamine by fermentation using a genetically engineered microorganism, especially E. Coli, that includes a modified GlcN6P synthase. Production of the clucosamine by recombinant strain 2123-149 (pxLN3-149) was marginally increased when compared to a strain expressing wild-type GlcNP synthase

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present sequence is that of a mutant, denoted GlcN6P-S-151, of the glucosamine-6-phosphate esynthase (GlcN6P synthase) of Escherichia coli. When compared with the wild-type sequence (see AAYS 8822), the mutant includes a Ser for Gly-472 amino acid substitution. This alteration was predicted from the mutaced glms gene in plasmid pKLN23-151 (see AAZS8254). The invention provides methods for the overproduction of glucosamine by fermentation using a genetically engineered microorganism, especially Econoli, that includes a modified GlcN6P synthase. Production of the glucosamine by recombinant strain 212-149 (pKLN21-149) was marginally increased when compared to a strain expressing wild-type Glc6NP synthase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   9

The present invention relates to a method (M1) for producing glucosamine and N-acetylglucosamine by fermentation. The method comprises (a) culturing in a fermentation medium a microorganism (1) which comprises endogenous glucosamine-6-phosphate acetyltransferase (II) and a genetic modification that increases the activity of (II), glucosamine-6-phosphate synthase (III) or glucosamine-6-phosphate extivity of (IV) and increases the activity of glucosamine-1 phosphate N-acetyltransferase (V), and (b) and collecting the product, which is chosen from the group consisting of glucosamine-6-phosphate, glucosamine-6-phosphate, n-acetylglucosamine-6-phosphate, and N-acetylglucosamine-1-phosphate, N-sequence was used to illustrate the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              241 YDAGDKGIYRHYWQKEIYEQPNAIKNTLTGRISHGQVDLSELGPNADELLSKVEHIQILA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          301 CGTSYNSGMVSRYWFESLAGIPCDVEIASEFRYRKSAVRRNSLMITLSQSGETADTLAGL
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     361 RISKELGYLGSLAICNVPGSSLVRESDLALMTNAGTEIGVASTKAFTTQLTVLLMLVAKL
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   SRLKGLDASIEHDIVHGLQALPSRIEQMLSQDKRIEALAEDFSDKHHALFLSRGDQYPIA

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention relates to a method (M1) for producing glucosamine and N-acetylglucosamine by fermentation. The method comprises (a) culturing in a fermentation medium a microorganism (I) which comprises endogenous glucosamine-6-phosphate acetyltransferase (II) and a genetic modification that increases the activity of (II), glucosamine-6-phosphate acetyltransferase (IV), or decreases the activity of (IV) and increases the activity of glucosamine-1 phosphate Acetyltransferase (IV), and (b) and collecting the product which is chosen from the group consisting of glucosamine-1 phosphate, N-acetylglucosamine-6-phosphate, acetylglucosamine-1-phosphate, and the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

```
The present sequence is that of wild-type glucosamine-6-phosphate synthase (GlcN6P synthase) of Escherichia coli strain Willo. The sequence is predicted from the isolated glums gene (see AAZSB249) in plasmid pKLN23 e.28. Recombinant nucleic acids encoding GlcN6P synthase are claimed, and are used for the expression of the enzyme in host microbial strains, especially E. coli, for use in the production of glucosamine. The invention also provides methods for the overproduction of glucosamine using a genetically engineered microorganism that encodes a GlcN6P synthase modifications comprise amino acid deletion, insertion, inversion, derivatisation or substitution, especially 14T, I272T, S240P, A39T, R250C, G472S and L469P substitution, of the present sequence
                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       SETDTEVIAHLVNWELKQGGTLREAVLRAIPQLRGAYGTVIMDSRHPDTLLAARSGSPLV 180

New polynucleotides for the identification and development of antibiotics, comprise sequences of antisense nucleic acids.

```
The invention relates to antisense inhibitors of genes essential to prokaryotic cellular proliferation, their use in identifying the genes, their use in the discovery of novel antibiotics, the essential genes of their use in the discovery of novel antibiotics, the essential genes themselves and the encoded proteins. The prokaryotes used are Escherichia coli, Staphylococcus aureus, Salmonella typhi, Klebsiella pneumoniae, coli, Staphylococcus aureus, Salmonella typhi, Klebsiella pneumoniae, cuseful for the identification of potential new targets for antibiotic development. The antisense nucleic acids can also be used to identify antibodies capable of binding to the expressed proteins. The proteins can taken to acreen compounds in rational drug discovery programmes. The proteins can used to acreen compounds in rational drug discovery programmes. The nucleic acids which are required for cell proliferation in a wide variety of organisms. The present sequence represents an essential prokaryotic cellular proliferation protein. Note: The sequence data for this patent celectronic format directly from WINDO at the printed specification, but was obtained in celectronic format directly from WINDO at

The invention relates to an isolated nucleic acid comprising any one of the 6213 antisense sequences given in the specification where expression of the mucleic acid inhibites proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated oplypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation or the activity of a gene in an operon required for proliferation or that inhibits cellular proliferation or the activity of the gene product or that has an activity against a biological pathway required for proliferation or that inhibits cellular proliferation of an organism acis, (9) manufacturing an antibiotic; (10) profiling a proliferation required for cellular proliferation of an organism. The arguing strains in which the gene or manufacturing an antibiotic; (10) profiling the extent or organism; or (13) identifying the arguing for homologous nucleic acids are useful for strains; or (13) identifying the target of a compound that inhibits the proliferation to isolate candidate molecules for rational drug discovery programs, or for screening for homologous nucleic acids are quired for proliferation to isolate candidate molecules for rational drug discovery programs, or for screening homologous nucleic acids are queited for the printed for proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. acruginosa. The present sequence as encoded by one of the target prokaryctic essential genes. Note: The sequence data for this parent did not format directly from Wipp at the sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      240

The present invention relates to a method (M1) for producing glucosamine and N-acetylglucosamine by fermentation. The method comprises (a) culturing in a fermentation medium a microorganism (I) which comprises endogenous glucosamine-6-phosphate acetyltransferase (II) and a genetic modification that increases the activity of (II), glucosamine-6-phosphate strip synthase (IV), or decreases the activity of (IV) and increases the activity of glucosamine-1 phosphate Hactivity of (IV) and increases the activity of glucosamine-1 phosphate which is chosen from the group consisting of glucosamine-6-phosphate, N-acetylglucosamine-6-phosphate, acetylglucosamine-1-phosphate, acetylglucosamine-1-phosphate, and N-acetylglucosamine-Theoremsene N-sequence was used to illustrate the method of the invention.
                                                                           900

The invention featers to a recombinant Una construct compirating a provide for expression of a polynucleotide encoding a polypeptide from a microbial source. The invention also relates to a transformed plant comprising the recombinant DNA construct and a method of producing a transformed plant comprising the recombinant DNA construct and a method of producing a transformed plant the recombinant DNA construct and growing the transformed plant with the recombinant DNA construct and growing the transformed plant, where the colymucleotide or polypeptide is useful for improving plant properties. The recombinant DNA construct is useful for producing plant properties. The recombinant DNA construct is useful for producing plant properties. The recombinant DNA construct is useful for producing plant with the improved plant properties, e.g. improved cold, heat or drought tolerance, colerance to herbicides, extreme osmocit conditions, pathogens or perts, increased resistance to plant disease, better growth rate by modification of the cell cycle pathway with plant growth regulators, increased rate of homologous recombination, modified seed oil or protein yield and/or content, improved lighth production of carbohydrate, nitrogen or phosphorus use and/or uptake, by modification of carbohydrate, nitrogen or providing improved lighth production or improved galactomannan condition, improved lighth production or improved galactomannan condition, improved lighth production or improved galactomannan complex condition, improved lighth production or improved galactomannan complex for the printed specification but was obtained in electronic form part of the printed specification but was obtained in electronic content in the printed specification but was obtained in electronic content in the printed specification but was obtained in electronic content in the printed specification but was obtained in electronic content in the printed specification of content in the printed specification in the printed specification in the printed speci
                                                                                                                                                                                                                                                                       New recombinant DNA construct comprising a promoter positioned to provide for expression of a polynucleotide encoding a polypeptide from a microbial source, useful for producing plants with improved properties.
                                                                                                                                                                                                                                                                                                                                                                                                                                                         invention relates to a recombinant DNA construct comprising

Producing chitin or chitosan, involves culturing microorganism with genetic modification that results in increase in activity of glutamine-fructos-6-phosphate amidotransferase, in fermentation medium, to produce chitin or chitosan.

Example 1; SEQ ID NO 23; 161pp; English.

The specification describes a method for producing chitin or chitosan by a fermentation process. The method involves culturing in a fermentation medium a microorganism which comprises one or more genetic modifications that result in an increase in the activity of glutamine-fructose-6-phosphate amidotransferase (also known as glucosamine synthetase and glucosamine-6-phosphate synthase, and encoded by the GFA1 eukaryotic gene and the glms bacterial gene), glucosamine-6-phosphate acetyltransferase (encoded by GNA1), chitin synthase or chitin deacetylase (encoded by GNA1), chitin synthase or chitin deacetylase (encoded by CDA1 and CDA2), or in decrease in the activity of N-acetylglucosamine-6-phosphate deacetylase, glucosamine-6-phosphate deaminase, chitinase and chitosanase, and collecting the chitin or chitosan. The method is useful for producing chitin or chitosan by utilizing microorganisms such as

fungus, yeast (e.g. Saccharomyces or Schizosaccharomyces ) and filamentous fungus (e.g. Aspergillus, Absidia or Rhizopus), preferably Scerevisiae, A. niger or A. nidulans. The method enables high quantities of chitin and chitosan to be produced cost effectively. The present sequence represents an Escherichia coli glucosamine-6-phosphate synthase. It was used to transform, yeast for use in the method of the invention.
                                                                                                                                                                 9
                                                                                                                                                                                        9

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   481
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              480
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         541
                                                                                                                                                                                                                New modified glutamine:fructose-6-phosphate amidotransferase, useful for identifying specific inhibitors, potentially useful for treating e.g. diabetes, contains a purification tag, also related nucleic acid.
                                                                                                                                                                                                                                                                                              This invention relates to a novel protein corresponding to human enzymatically active but modified glutamine:frucese-f-phosphate amidotransferase (GFAT). The invention may be useful for the production of compounds with an antidiabetic, anorectic, metabolic, cytostatic, osteopathic, fungicide or herbicide activity. The invention may be used to screen for agents that modify, especially inhibit, its activity, potentially useful as agents for treatment or prevention of diabetes (particularly type II), obesity, acidosis, ketosis, cancer and useful as herbicides and fungicides, respectively. The present sequence is that of a human GFAT-like protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                61
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           9

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ઠે
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present sequence is that of a mutant, denoted GlcN6P-S-124, of the glucosamine-6-phosphate synthase (GlcN6P synthase) of Escherichia coli. When compared with the wild-type sequence (see AAY58822), the mutant includes a Leu-469 to Thr amino acid substitution. This alteration is predicted from the muated glmS gene in plasmid pKLN23-124 (see AAZ58252). The invention provides methods for the overproduction of glucosamine by fermentation using a genetically engineered microorganism, especially Ecoli, that includes a modified GlcN6P synthase. Production of the glucosamine by recombinant strain 2123-124 (pKLN33-124) was significantly increased when compared to a strain expressing wild-type GlcGNP synthase owing to reduced product inhibition
